SUMMARY

9 years of product design in enterprise B2B SaaS, working directly with founders and leading design across the organisation. At Xoxoday I was the lead designer for the admin platform used by 4,000+ enterprise clients and the rewards marketplace used by 65 million users across 150 countries. I covered both product surfaces and built the design system all Xoxoday products are built from. I led the shift to AI-native product development workflows, changing how design and engineering build and ship together. I think in systems and care about getting the foundations right before anything else scales.

EXPERIENCE

Xoxoday · Senior Product Designer

January 2019 – Present · Bengaluru

AI-powered platform for rewards, incentives, and loyalty. Core product Plum sends and manages rewards for 4,000+ enterprise clients across 150 countries, reaching 65 million end-users and over \$5B in rewards distributed. Lead designer for its admin platform and the rewards marketplace. Design system owner across all products. Worked directly with founders throughout, leading design across the organization.

Admin Platform

- Simplified how enterprise admins send rewards to tens or thousands of recipients at a time, across reward types, countries, and delivery methods, cutting the time it took to send a reward, and improving adoption for a platform used by 4,000+ enterprise clients in 150 countries.
- Simplified the tools admins use to set up reward campaigns and manage storefronts, including branding, white labeling, redemption experience, and product and category selection, across a catalogue of 10M+ options, cutting time to launch and support dependency to manage them.
- Structured and scaled enterprise data across reward, redemption and order reports, building table structures and dashboards that reduced time and effort admins spent discovering, managing and interpreting data.
- Redesigned the payment, reconciliation, and financial reporting workflows finance teams use to manage transactions across multiple accounts and currencies. Cut support dependency for finance teams by ~25-35%.
- Handled all the supporting functions that kept the platform running: admin settings, access management, security controls, and onboarding. Structured settings so admins could configure roles and permissions on their own, and rebuilt the onboarding flow, cutting drop-offs by ~70% and improving activation by ~12%.

Reward Marketplace

- Simplified navigation, search, filters, product listing and detail pages so users could browse, discover and select rewards inside a catalogue of 10M+ options, cutting the time it took to choose rewards, for 65 million users across 150+ countries.
- Managed how categories such as physical products, digital gift cards, payout options, travel options like flights and hotels and many more sat within the same platform, and led new category launches and seasonal events using frameworks that cut the time it took to launch each one.
- Simplified the redemption flow, from receiving a reward to managing a cart across multiple categories, checkout, and order tracking and management, reducing support tickets related to redemption and order issues.

Design System

- Built Xoxoday's design system from scratch and stayed its sole owner as the team grew from 2 to 9-15 designers.
- Built and managed the base library including foundation, token architecture, accessibility standards, and base components, used by every product and the marketing team.
- Adopted the base library into the admin platform and rewards marketplace as sole custodian, constructing its product-specific component library with variants for every use case.
- Decided what got built, redesigned, or retired across the system, setting the standard every designer and engineer built against.
- Guided designers on other products and marketing to adapt the base library into their own, documenting and teaching the system for independent use.
- Cut engineering build time by ~20-30% and held brand consistency at ~95-98% across all products.

AI Native Workflows

- Built the design and engineering foundation that let the team use AI for product development. Connected drifted design and frontend patterns across multiple products into one shared system that AI can read, so teams could ideate and build pages directly in production environments without writing code.
- Cut duplicate frontend effort by 30-40%, reduced engineering build time, improved brand consistency across products, and made AI output reliable.
- Worked closely with engineering to make sure the system held up with actual code, while setting how it was extended and adopted across product and engineering teams through workshops, documentation, and review.
- Ideate and design directly in the codebase alongside Figma using AI coding agents, raising own pull requests, cutting the time it takes to move from idea to shippable feature.
- Explored and introduced AI tools across research, prototyping, copy, collaboration and quality testing. Also led AI initiatives beyond product design, including an AI-readable brand book to create marketing assets, and partnered with the product team to build an AI-powered demo tool.

Design Leadership

- Operated as the senior design voice in the company, presenting work directly to founders and shaping platform and roadmap decisions before they were scoped.
- Built and led the design team, taking direct management of 5-8 designers as the function grew across product and marketing. Hired for design roles, mentored and developed junior designers, building a team that could take features end to end.
- Managed how the design team worked day to day. Owned Figma administration across the organization, defined PM-design-dev collaboration standards, critique and review structures, onboarded new designers and contributed to sprint planning and delivery.

Gapoon (now DusMinute) · UX/UI Designer

June 2017 – December 2018 · Bengaluru

Home services marketplace for on-demand home maintenance and repairs, serving customers, vendors, and operations across a two-sided platform.

Designed end-to-end user flows, interaction patterns, and UI systems across three platforms: customer, vendor, and admin, on both web and mobile. Covered the full product surface from discovery and booking through to job completion and payments.

Algebra Analytics · UX/UI Design Intern

March 2017 – June 2017 · Bengaluru

Restaurant tech platform for analytics and operations management. Designed the entire product experience for the tool, used by restaurant managers and owners.

SKILLS

Design & Research

UX UI, Wireframing, Prototyping, Interaction Design, Visual Design, Accessibility, Information Architecture, Design and Product Thinking, Usability and User Testing, UX Copy, Data Informed Design, User Research

Systems & AI

Design Systems, Design to Code, AI Native Workflows, Generative and Agentic AI, Vibe Coding, System Thinking

Leadership & Domain

People Management, Hiring and Mentorship, Design Operations, Cross Functional Management, Stakeholder Management, Enterprise B2B SaaS, Storefront Configuration, Rewards and Incentives, Agile

TOOLS

Figma, Claude Code, GitHub, Cursor, VS Code, Google Analytics, Hotjar, Maze, Claude and ChatGPT

EDUCATION

BE, Electronics and Instrumentation Engineering, Sathyabama University, Chennai, 2011-2015
